

# WRITING STYLE GUIDE

The FurtherAI blog voice is confident, conversational, and authoritative without being stiff or overly technical.

It reads like a knowledgeable colleague explaining an insight over coffee, not a whitepaper or press release. The writing respects the reader's intelligence and avoids hype-language.

Use real data, customer outcomes, and FurtherAI-specific examples where possible. Structure for AI extractability: clear headings, direct answers, bold key claims.

Minimum 600 words per post; most GEO articles perform better at 800–1,200 words. Maintain FurtherAI brand voice throughout.

## *The FurtherAI writing voice is:*

- Confident but not boastful, we let results speak
- Grounded and specific, no generic AI hype
- Operator-level, written for underwriters and claims teams, not tech enthusiasts
- Clear and editorial; say less, but better
- Human, the people running insurance are real; write like you know them

## General principles for blog content

We aim for our content to serve both human readers and AI agents. **Fortunately, most principles that make reading a pleasant experience for people is what makes content appealing to AI agents.**

Well-structured information:

- **Hierarchical heading.** Using H1, H2s, and H3s makes it easy for readers, both human and not, to scan information and fast-forward to the part they are most interested in.
- **Subheadings every 3-5 paragraphs.** To make information more accessible for human readers and easily fetchable for AI models, keep sections of your articles reasonably short.
- **Key Takeaways and FAQ.** Most articles should contain Key Takeaways and FAQ sections with clear direct answers to contextually relevant questions. This helps human readers find information they are looking for quicker and allows AI models to quickly fetch, understand, and cite content.
- **Tables.** Make sure tables aren't just screenshots added as images (those can't be read by AI properly). Build actual tables, ensure columns and rows have clear and descriptive headers, use "N/A" for cells with no data because empty cells might be

read by AI as an indicator of a broken table. Don't create tables that are excessively long and complex and, therefore, impossible to comprehend for a human.

- **Bulleted and numbered lists.** Use numbered (ordered) lists when indicating steps or hierarchy and bulleted (unordered) lists for non-sequential items. Lists make information easier to digest for humans and offer better scannability for AI.

*Note: usage of lists should be contextually justified. Don't break random information into lists just because.*

Overall readability:

- **Human voice.** Prioritize active, present-tense voice. Use contractions to keep your writing conversational. Write from a first-person plural "we" for the company voice and use "you/your" to address the reader directly.
- **Clear direct answers.** Think of information as a pyramid structure, where you answer the question as early and as specifically as possible in the article and only then dive into more details and subtopics later.
- **Reasonably short paragraphs.** We don't want one sentence per paragraph, but we don't want half-page-long chunks of dense text either. Aim for paragraphs of 3-4 lines, but also feel free to make them a bit shorter or longer when it makes sense contextually and would improve readers' experience.
- **Sentence length variability.** A mix of punchy, short sentences and longer, complex ones, make writing more rhythmic and engaging.

## Alisms or AI writing cliché

**Absolutely avoid "Contrast framing" sentence structure such as:**

*"It's not just X, it's also Y."*

*"It's not about X, it's about Y."*

*"It's not A. It's not even B. It's C."*

**Do not start your paragraphs with cliché preambles and formulaic openings like:**

*"Here's the thing..."*

*"In the world of..."*

*"At its core..."*

*"The X is quietly revolutionizing..."*

*"This is game-changing..."*

**Use the "rule of three" sentence structure sparingly, only where it is absolutely necessary, and no more than once or twice per article.**

*"It's [adjective X], [adjective Y], and [adjective Z]."*

*"Our platform is X, Y, and Z"*

*"[Verb] X. [Verb] Y. [Verb] Z."*

## Punctuation & Capitalization

Always use the Oxford comma.

*"Track turnaround time, error rates, and renewal lift to quantify results."*

No exclamation marks in body copy.

Use em dashes sparingly, only when contextually justified; use spaces before and after an em dash.

*"Orchestration coordinates the flow of automated tasks — sending summaries, assigning follow-ups, and tracking responses."*

Use Title Case for H1s (blog titles) and sentence case for all subheadings

H1: *"2026 Guide to Automated Renewal Summaries for Commercial Underwriting Teams"*

H2: *"Understanding automated renewal summaries in commercial underwriting"*

Use lower case after colon and semicolon

*"The shift is fundamental: the entire UI is collapsing."*

*"Most platforms treat intake as a data entry problem; we treat it as a decision intelligence problem"*

## Dates, percentages, and numbers

Spell out one–nine; use digits for 10+

*"three years ago" / "over \$100M"*

To indicate currency or percentage, use symbols with digits

*"down 40%" / "more than \$25M"*

For dates, use a standard American [Month Day, Year] format

*"March 26, 2026"*

To indicate date ranges, use an en dash, not a hyphen

*"March 22 – 25, 2026"*

## Abbreviations, Acronyms, and Contractions

Spell out on first use, then abbreviate

*managing general agent (MGA), large language models (LLMs)*

Use contractions freely; they make language more human and conversational

*don't, can't, shouldn't, we're, that's*

## **Brand & Industry Terminology**

"FurtherAI" (one word, capital F and AI) — never "Further AI" or "further ai"

"AI" (all caps). Spell out "artificial intelligence" only on first use if the audience warrants it

"LLMs" or "large language models" — no period between letters
